### **BOR 8 RODS**

*Protects Wood Against Fungal Decay  
Solid Wood Preservative*

- Bor8 Rods are supplemental wood preservatives for treatment of utility poles, railroad crosssties, bridge timbers, marine pilings and any place where wood gets wet enough to rot.
- Bor8 Rods are inserted into drilled holes and sealed with a removable and reusable plug. When the wood gets wet enough to rot, the rods dissolve and diffuse throughout the wet wood.
- Over 25 years in existence with a researched track record of efficacy
- Can be used in new or existing wood as a supplemental wood preservative
- Stops existing decay and prevents decay for at least 10 years.
- Once the rods diffuse, the wood becomes toxic to beetles, termites and carpenter ants.
- Wood can be re-treated with Bor8 Rods every 10 years using existing holes and plugs extending the useful life by many decades.
- Cost effective alternative to replacement
- Virtually nontoxic to mammals, fish, birds and the environment
- Easy to use, predictable results, non-hazardous
